

Solstice Robotics -- Q2 2026 Investor Update

Prepared by Maria Chen (CEO) and David Okoye (CTO). Solstice Robotics closed Q2 2026 with continued progress on both Project Meridian and Project Halcyon, and is preparing a Series B raise for early 2027.

Headcount

Solstice Robotics ended Q2 2026 with 10 employees across Austin HQ, the Des Moines office, and remote roles, up from 6 a year earlier. Priya Nair's Engineering team grew to 6 people with the addition of Ravi Subramaniam as Data Scientist, and Grace Kim's People Operations team opened a new firmware engineer requisition to support both flagship projects.

Project Meridian

The GreenField Farms pilot in Iowa, led on-site by Jordan Blake with firmware support from Sam Whitfield, remains Solstice's first paying customer engagement. A firmware power-draw issue pushed the pilot's second flight window from June 15 to June 29, but early crop-stress detection results have matched GreenField Farms' agronomist assessments in 9 of 10 flagged zones.

Project Halcyon

The swarm-coordination proof of concept with AgriNova Cooperative in Nebraska wrapped in Q1. Ravi Subramaniam's updated pathing algorithm reduced flight-path overlap by 18% versus the naive grid-search baseline used in that proof of concept. General availability, led by David Okoye, remains targeted for Q4 2026.

Financing

Solstice Robotics closed a \$12M Series A in January 2023, led by Terra Ventures with participation from AgFirst Capital. The company is targeting a Series B in early 2027, timed to the Project Halcyon general-availability launch, and Tom Alvarez's Sales team is building a pipeline of reference customers beyond GreenField Farms and AgriNova Cooperative ahead of that raise.
